

Aliaksandr Dudkin

Software Engineer

Education

Software Engineering and
Computer Science

Languages

English — B2

Domains

Food Delivery
Transportation

Software Engineer with 4 years of experience in designing and developing distributed microservices systems and full-stack business applications. Proficient in the Java and Spring ecosystem (Core, Boot, MVC, Security, Data), with solid experience in building reliable service layers, secure APIs, and data-driven backend components. Skilled in containerizing applications and supporting cloud deployments on AWS and Kubernetes, as well as implementing asynchronous workflows with Apache Kafka. Experienced in IAM integration using Keycloak, performance-oriented persistence with PostgreSQL, MongoDB, and Redis, and automated testing with JUnit, Mockito, and Testcontainers. Combines backend development with practical frontend delivery using React, while following CI/CD, code review, and Agile delivery practices.

Programming languages

Java, JavaScript.

Backend

Spring (Boot, MVC, Web, Security, Data, Cloud), Hibernate, JPA, Keycloak, REST, SOAP, Liquibase, Flyway, Swagger, Maven, JUnit, Mockito, Testcontainers.

Frontend

React, HTML, CSS.

Databases

PostgreSQL, Microsoft SQL Server, MongoDB, Redis.

Cloud

AWS (EKS, S3, Lambda, CloudWatch, EC2).

Message Brokers

Apache Kafka.

DevOps & CI/CD

Docker, Kubernetes, Jenkins, GitHub Actions.

Source control systems

Git, GitHub.

AI Tools

Codex, Claude.

Project management tools

Jira, Confluence.

Projects

Food Delivery Platform

A food delivery platform designed for online ordering, restaurant operations, courier dispatching, and real-time delivery tracking. The platform supports menu management, order lifecycle automation, payment status processing, and customer-facing order visibility.

Project Roles

Software Engineer

Period

11.2024 – till now

Responsibilities

- Developed order orchestration logic in Java and Spring Boot, covering cart-to-order conversion, order state validation, cancellation rules, and hand-off to delivery services;
- Built REST APIs for restaurant catalog, customer order visibility, and support tooling with Spring MVC, Spring Security, Keycloak, Swagger, and Maven;
- Implemented transactional persistence for orders, menus, payments, and status history using PostgreSQL, Hibernate, JPA, Spring Data, and Liquibase;
- Added Redis-backed read models for menu data, order status snapshots, and courier availability to reduce repeated PostgreSQL reads;
- Connected order, payment, delivery, and notification services through Apache Kafka events

and Spring Cloud integration components;

- Maintained MongoDB collections for delivery events, audit records, and integration logs used by support teams;
- Containerized Java services with Docker and supported Kubernetes deployment configuration on AWS, including health checks and runtime parameters;
- Maintained Jenkins pipelines for Maven builds, JUnit, Mockito, and Testcontainers test execution, Docker image publishing, and staged deployments;
- Delivered React, JavaScript, HTML, and CSS updates in customer and operations portals for live order tracking, filters, and dashboards refinements;
- Used Git, GitHub, Jira, Confluence, Codex, and Claude during code review, issue analytics, and delivery planning.

Environment

Java, JavaScript, Spring (Boot, MVC, Web, Security, Data, Cloud), PostgreSQL, Hibernate, JPA, Liquibase, Redis, MongoDB, Apache Kafka, React, REST, SOAP, Docker, Kubernetes, AWS (EKS, S3, Lambda, CloudWatch, EC2), JUnit, Mockito, Testcontainers, HTML, CSS, Git, GitHub, Jenkins, Swagger, Maven, Codex, Claude, Jira, Confluence.

Taxi Aggregator Platform

A taxi aggregator platform for ride ordering, driver matching, trip tracking, fare calculation, and dispatch operations. The system connects passengers, drivers, and support teams through real-time trip updates and operational management tools.

Project Roles

Software Engineer

Period

06.2022 – 10.2024

Responsibilities

- Implemented ride-booking backend services in Java and Spring Boot for trip requests, driver acceptance, cancellation rules, and trip state transitions;
- Built dispatcher and driver-facing REST endpoints with Spring MVC, Spring Security, Keycloak, and Swagger contract documentation;

- Refined matching workflows with Apache Kafka, publishing driver availability, trip status, pricing recalculation, and notification events;
- Modeled trip, driver, fare, and dispatch data in PostgreSQL using Hibernate, JPA, Spring Data, and Flyway migrations;
- Processed driver telemetry and trip audit trails in MongoDB, with Redis caches for driver availability, tariff rules, and active trip snapshots;
- Integrated selected back-office exchanges with SOAP and Microsoft SQL Server for operational reporting and legacy dispatch data;
- Prepared Docker and Kubernetes configuration for Java services on AWS and maintained GitHub Actions build and deployment workflows;
- Built React, JavaScript, HTML, and CSS screens in the dispatcher dashboards for live trips, driver queues, operational filters, and UI fixes;
- Covered booking, matching, pricing, and Apache Kafka integration flows with JUnit, Mockito, and Testcontainers;
- Used Git, GitHub, Jira, and Confluence with QA, product owners, and operational stakeholders to release features and analyze incidents.

Environment

Java, JavaScript, Spring (Boot, MVC, Security, Data, Cloud), PostgreSQL, Hibernate, JPA, Flyway, Redis, Keycloak, MongoDB, Apache Kafka, React, Docker, Kubernetes, AWS, REST, HTML, CSS, JUnit, Mockito, Testcontainers, GitHub Actions, Git, GitHub, Swagger, Maven, Jira, Confluence, Microsoft SQL Server.
